Corres.PCT App.No	PCT/EP01/01551	Dated : 13.02.2001
Priority Document No.	No. 0006555.7	Dated : 17/03/2000
Name of the Applicant	Societe des produits nestle S A, Switzerland	
Title of Invention	Digestable chewing gum	

Nationalphase App.No	IN/PCT/2002/01460/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/FI01/00272	Dated : 19.03.2001
Priority Document No.	No. 20000647	Dated : 20/03/2000
Name of the Applicant	ABB research ltd., Switzerland	
Title of Invention	Method of determining speed of rotation of squirrel - cage motor and a computer software product to carry out the method	
Nationalphase App.No	IN/PCT/2002/01461/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/EP01/02518	Dated : 02.03.2001
Priority Document No.	No. 00200987.6	Dated : 17/03/2000
Name of the Applicant	Flexsys B V, Netherlands	
Title of Invention	Rubber vulcanizates having improved ageing properties	
Nationalphase App.No	IN/PCT/2002/01462/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/EP01/02829	Dated : 13.03.2001
Priority Document No.	No. MI2000A000547	Dated : 17/03/2000
Name of the Applicant	Enichem S P A & others, Italy	
Title of Invention	Continuous process for the synthesis of aromatic urethanes	
Nationalphase App.No	IN/PCT/2002/01463/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/NZ01/00045	Dated : 23.03.2001
Priority Document No.	No. 338015	Dated : 23/03/2000
Name of the Applicant	Pivotal engineering limited, New Zealand	
Title of Invention	Piston for an internal combustion engine	
Nationalphase App.No	IN/PCT/2002/01464/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/JP01/02035	Dated : 15.03.2001
Priority Document No.	Nos. 09/527, 573; 09/730, 830	Dated : 16/03/2000
Name of the Applicant	Sucampo AG, Switzerland	
Title of Invention	Treatment of ocular hypertension and glaucoma	
Nationalphase App.No	IN/PCT/2002/01465/CHE	Dated : 16.09.2002
Corres.PCT App.No	PCT/JP01/01815	Dated : 08.03.2001

Name of the Applicant	Koninklijke Philips electronics NV, Netherlands	
Title of Invention	Robust checksums	
Nationalphase App.No	IN/PCT/2002/01469/CHE	Dated : 17.09.2002
Corres.PCT App.No	PCT/US01/09179	Dated : 20.03.2001
Priority Document No.	No. 09/532, 492	Dated : 22/03/2000
Name of the Applicant	Qualcomm incorporated, USA	
Title of Invention	High efficiency, high performance communications system employing multi - carrier modulation	
Nationalphase App.No	IN/PCT/2002/01470/CHE	Dated : 17.09.2002
Corres.PCT App.No	PCT/JP01/10126	Dated : 20.11.2001
Priority Document No.	No. 2001 - 12476	Dated : 19/01/2001
Name of the Applicant	Honda giken kogyo kabushiki kaisha, Japan	
Title of Invention	Side stand device for motorcycles	
Nationalphase App.No	IN/PCT/2002/01471/CHE	Dated : 17.09.2002
Corres.PCT App.No	PCT/DE01/02598	Dated : 11.07.2001
Priority Document No.	No. 100 65 014.7	Dated : 23/12/2000
Name of the Applicant	Robert Bosch GMBH, Germany	
Title of Invention	Wiper device, especially for windshields of automobiles	
Nationalphase App.No	IN/PCT/2002/01472/CHE	Dated : 17.09.2002
Corres.PCT App.No	PCT/JP01/02418	Dated : 26.03.2001
Priority Document No.	No. 2000 - 144439	Dated : 17/05/2000
Name of the Applicant	Ajinomoto co, Inc., Japan	
Title of Invention	Process for producing cysteinylglycine - enriched food material and process for producing flavor - enhancing agent	

Nationalphase App.No	IN/PCT/2002/01473/CHE	Dated : 17.09.2002
Corres.PCT App.No	PCT/EP01/01719	Dated : 16.02.2001

COMPLETE SPECIFICATION ACCEPTED

Notice is hereby given that any person interested in opposing the grant of a patent on any of the applications concerned, may, at any time within four months from the date of this issue or within such further period not exceeding one month if applied for on Form 4 prescribed under the Patent (Amendment) Rules, 1999 before the expiry of the said period of four months, give notice to the Controller of Patents at the appropriate office on the prescribed Form 7 of such opposition. The written statement of opposition should be filed in duplicate alongwith evidence, if any, with said notice or within sixty days of its date as prescribed in Rule 36 as amended by the Patents (Amendment) Rules, 1999.

The Classification given below in respect of each specification are according to Indian Classification and International Classification Systems.

Printed copies of the specification and drawings, if any, can be supplied by the Patent Office or its branch offices on payment of prescribed charges of Rs. 30/- each.

In the event of non-availability of printed specification, photocopies of the specification and drawings, if any, can be supplied by the Patent Office and its branch offices on payment of prescribed photocopy charges of Rs. 10/- per page of such document plus Rs. 30/-.

8 CLAIMS.

An integrated optic polarization device comprising :

A substrate having, at a predetermined wavelength, a first extraordinary refractive index and a first ordinary refractive index different from said extraordinary refractive index;

A first waveguide formed in said substrate by titanium indiffusion, said first waveguide having a second extraordinary refractive index and a second ordinary refractive index, said second extraordinary and ordinary refractive indices being greater than said first extraordinary and ordinary refractive indices of said substrate to transmitting both a transverse electric mode component and a transverse magnetic mode component of an input signal, said first waveguide having an input for receiving said input signal and an output for outputting only one of said transverse electric mode and transverse magnetic mode components;

A second waveguide formed, using proton exchange, in said substrate, said second waveguide being physically separate from said first waveguide, said second waveguide having said second extraordinary refractive index and a third ordinary refractive index less than said first ordinary refractive index of said substrate, said second waveguide having an initial portion of predetermined length parallel to a first portion, having said predetermined length, of said first waveguide, said initial portion completely passing the other one of the said transverse electric mode and transverse magnetic mode components from said first waveguide to an output of said second waveguide.

5 CLAIMS

A process for preparing a photovoltaic device consisting of a film on a substrate, which comprises the following steps in combination :—

viii) derivatizing the surface of the substrate in a manner such as herein described to introduce a linking means 'L' onto the substrate, said linking means having a terminating unit Y^1O_3 ;ix) treating the substrate with a reagent providing Me^3 ions;

x) washing the substrate with water;

xi) treating the substrate with a solution of bisphosphonic acid or bisarsonic acid of the formula—

xii) washing the substrate with water,

xiii) treating the substrate with a reagent providing Me^1 ions;

xiv) sequentially repeating aforementioned steps (iii) to (vi) to obtain the desired number of layers ("K") and arriving at a substrate with a film illustrated by the formula

Wherein-

L is a linking means such as herein described;

each of y^1 and Y^2 , independently of the other, is phosphorous or arsenic;Z is $-(R^1)_n-Z'-(R^2)_m$; in which Z' is a divalent aromatic group containing at least two conjugated tetravalent nitrogen atoms; each of n and m , independently of the other, has a value of 0 or 1, and each of R^1 and R^2 , independently of the other, is a divalent aliphatic or aromatic hydrocarbon group;

X is an anion;

 Me^y is Me^1 W m wherein Me^1 is a divalent, trivalent, or tetravalent metal of group III, IV A or IV B having an atomic number of at least 21 or a Lanthanide; W is an anion; n is 1, 2 or 3; m is 0, 1, 2, 3, or 4;

K has a value of from 1 to about 250 and the asterisk (*) designates multiplication;

p has a value of 0, 1, 2 or 3;

q is the charge on x

each of Y^1 , Y^2 , Z and Me^1 may be different for each successive K, Layer, and wherein each of the said compound film is bound to said substrate through the said linking means, L

An S/N (signal to noise) enhancer, comprising:

A. A first ferromagnetic substrate adapted to have a DC magnetic field applied thereto; a first input-side transducer having two ends and being disposed on said first ferromagnetic substrate;

a first output-side transducer having two ends and being disposed in parallel to said first input-side transducer on said first ferromagnetic substrate;

B. a second ferromagnetic substrate adapted to have a DC magnetic field applied thereto;

A second input-side transducer having two ends and being disposed on said second ferromagnetic substrate;

A second output-side transducer having two ends and being disposed in parallel to said second input-side transducer on said second ferromagnetic substrate;

C. an input terminal connected to one end of said first input-side transducer;

A first attenuator, connected between the other end of said first input-side transducer and one end of said second input side transducer, for attenuating a signal which passes through said first input-side transducer;

A second attenuator, connected between one end of said first output-side transducer and one end of said second output side transducer, for attenuating a signal which passes through said first output-side transducer ; and

An output terminal connected to the other end of said second output-side transducer, wherein the other end of said output-side transducer is grounded , and other end of said second input-side transducer is grounded,

Where by noise nose which passes through said first attenuator and noise which passes through said second attenuator have respective phases so as to cancel each other anterior to said to said output terminal.

4-CLAIMS.

A circuit capable of suppression of arcing across electrical switching contacts, which comprise first and second switch contacts (18,20) and a movable arm (16) which moves between the first and second switch contacts, the circuit comprising:

an insulated gate bipolar transistor (IGBT) (36). comprising a Darlington combination of a field effect transistor and a bipolar junction transistor, connected across said switching contacts;

a capacitor (30) connected at one end to a collector portion of the IGBT and said first switch contact (18) and connected at the other end to a gate portion of the IGBT and said second switch contact (20), wherein the capacitor adds to the stray capacitance of the IGBT so that the combined capacitance is such that in response to a current therethrough, the resulting voltage across the combined capacitance produces a large enough charge at the gate portion of the IGBT to turn the IGBT on, which action in turn limits the voltage across the capacitance to such a value which is just sufficient to maintain the IGBT in conduction, wherein the voltage across the IGBT is sufficiently limited that arcing across the contacts is prevented;

means (14) connecting said first switch contact and said movable arm (16) to a voltage source and a load in such a way that current flows through the switching contacts when said movable arm is in a closed position against said first switch contact;

means connecting said movable arm to an emitter portion of the IGBT such that when said movable arm is in an open position against said

second switch contact, any charge which is present on the gate-to-emitter junction of the IGBT (36) is discharged through said second switch contact and the movable arm; and means (22) connected between said first switch contact and said movable arm for preventing current therethrough until a specified voltage is reached thereacross, which occurs when said movable arm contacts said second switch contact and for dissipating current in the circuit after the IGBT has turned off, thereby preventing damage to the IGBT.

(Claims 35)

An improved slackless type drawbar assembly for connecting adjacently disposed ends of a pair of railway cars together in a semi-permanent manner, said slackless drawbar assembly provided with a drawbar having a first male connection member engageable with an end of a first railway car and a second male connection member engageable with an end of an adjacently disposed end of a second railway car, said slackless drawbar assembly characterized by:

(a) a first female connection member, having a first configuration, engageable in one end of a center sill portion, which is secured to a bottom portion of a car body member, of a first railway car;

(b) a first cavity formed in said first female connection member, said first cavity being delimited by a back wall portion, having a second configuration, and a first pair of side wall portions, having a third configuration;

(c) a first opening, having a fourth configuration, extending through a first one of said first pair of said wall portions;

(d) an axially opposed second opening, having a fifth configuration, extending through a second one of said first pair of side wall portions;

(e) a first male connection member, having a sixth configuration, at least a portion of a first end of said first male connection member being movably disposed within said first cavity formed in said first female connection member;

(f) a first aperture formed through a portion of said first male connection member adjacent said first end thereof;

(g) a first spherical shaped member, at least a portion of said first spherical shaped member being disposed within said first aperture formed through said first end of said first male connection member;

(h) a first pair of horizontally disposed shaft members extending outwardly for a distance from axially opposed outer surfaces of said first spherical shaped member, at least a portion of a first one of said first pair of shaft members being disposed within said first opening extending through said first one of said first pair of side wall portions and at least a portion of a second one of said first pair of shaft members being disposed within said second opening extending through said second one of said first pair of side wall portions, each respective one of said first pair of shaft members has an axially opposed and flat surface portion formed thereon;

(i) a first race assembly having at least a portion thereof disposed within said first aperture and secured to said first end of said first male connection member, an inner surface of said first race assembly being disposed around said portion of said first spherical shaped member disposed within said first aperture formed in said first male connection member;

(j) a second female connection member, having a seventh configuration, engageable in one end of a center sill portion, which is secured to a bottom portion of a car body member, of a second railway car

(k) a second cavity formed in said second female connection member, said second cavity being delimited by a back wall portion, having an eighth configuration, and a second pair of side wall portions, having a ninth configuration;

(l) a third opening, having a tenth configuration, extending through a first one of said second pair of side wall portions of said second cavity;

(m) an axially opposed fourth opening, having an eleventh configuration, extending through a second one of said second pair of side wall portions of said second cavity;

(n) second male connection member having a twelfth configuration, at least a portion of a first end of said second male connection member being movably disposed within said second cavity formed in said second female connection member;

(o) a second aperture formed through a portion of said second male connection member adjacent said first end thereof;

(p) a second spherical shaped member, at least a portion of said second spherical shaped member being disposed within said second aperture formed through said first end of said second male connection member;

(q) a second pair of horizontally disposed shaft members extending outwardly for a distance from axially opposed outer surfaces of said second spherical shaped member, at least a portion of a first one of said second pair of shaft members being disposed within said third opening extending through said first one of said second pair of side wall portions and at least a portion of a second one of said second pair of shaft members being disposed within said fourth opening extending through said second one of said second pair of side wall portions, each respective one of said second pair of shaft members has an axially opposed and flat surface portion formed thereon;

(r) a second race assembly having at least a portion thereof disposed within said second aperture and secured to said first end of said second male connection member, an inner surface of said second race assembly being disposed around said portion of said second spherical shaped member disposed within said second aperture formed in said second male connection member;

(s) engagement means for engaging a second end of said first male connection member and a second end of said second male connection member for securing said second end of said first male connection member to said second end of said second male connection member;

(t) a first pair of wedge means, a first one of said first pair of wedge means being engaged with a first one of said axially opposed and flat surface portions formed on said first pair of shaft members and a second one of said first pair of wedge means being engaged with a second one of said axially opposed and flat surface portions formed on said first pair of shaft members; and

(12 Claims)

Device for the distribution bulk materials comprising

a chute (10) for the delivery of materials in bulk,

a first rotor (18) with a substantially vertical rotation axis (12), the chute (10) being suspended from the said first rotor (18) so as to be driven in rotation by this rotor and so as to be able to pivot about a substantially horizontal pivoting axis (33),

a second rotor (40) with a rotation axis substantially coaxial with the said first rotor (18), characterised in that

a pivoting ring (38) connected to the chute (10) at two points (34,34) diametrically opposite each other with respect to the pivoting axis (33) of the chute (10) so that it can itself pivot about an axis (36) perpendicular to the horizontal pivoting axis (33) of the chute, and

a guide means (52) which is supported by the second rotor (40) and which is in contact with the pivoting ring (38) at least at three points so as to define for the said pivoting ring, in a coordinates system attached to the second rotor (40), an inclined plane of rotation which makes an angle α with a horizontal reference plane.
